ICIPE 1975

THE STATUS OF INSECT SCIENCE IN THE TROPICAL WORLD:

A series of ICIPE Annual Public Lectures Delivered by the ICIPE Director

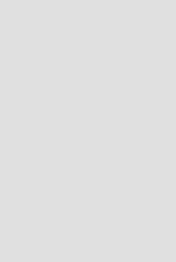

"THIS IS A DUDU WORLD"

Ву

Professor Thomas R. Odhiambo

First Lecture 4th June 1975 ICIPE Research Centre NAIROBI

THE INTERNATIONAL CENTRE OF INSECT PHYSIOLOGY AND ECOLOGY P.O. BOX 2072, NAIROBL KENYA

THE STATUS OF INSECT SCIENCE IN THE TROPICAL WORLD

THE SERIES of ICIPE Annual Public Leature wall be devoted to the general them of "The Statute of Leature wall be devoted to the general them of "The Statute of Leature wall sell; year assemble of World". In it the ICIPE Discover will sell; year assemble of the Company of the

In this locture Professor Thomas R. Obhlambo examinor to himportant rolls that rich luned frame of rough affects has played in its initizery, health and economic life. He contends that a more magnetise look notes to be taken of this budgeonic plotting and presence. With restoods ameliterities related by the prevailing arterior with the content of the content of the content of the horizon of synthetic periodical, now challenges are before mankind to discover now management practices for this crecial portion of our horizon of synthetic periodical professor of the crecial portion of our simulation of the content of the promising lines of investigations, and the american sense are

Professor Thomas R. Obhambo come to Nairobi in hily 1963 at ree pending at yars it Queen's College, Cambridge, during which he obtained his degrees of B.A., M.A. and Ph.D. the latter in insect he physiology. His years In Cambridge, were convend by many scholatta adventures, and were financed by a scholattalig from the years of Cambridge and Colleges of the College

He was born in Mombasa, started formal schooling at Kisumu and Ngiya, before going to Maseno for his secondary education, He attend the them Makesere Collegia in 1950, and spent four years there, the last two of which he used to specualise in Entomology, Nematolose, and Soil Biology. He then joined the Tea Research In-

strute of East Africa at Kericho, where he worked as a Technical Officer for eighteen months before joining the Uganda Ministry of Agriculture.

He joined the University of Natrob In 1955 as a Special Lecture in Zooley, under the Rockelier Fountation scheme for staff transa, Two years later he became Serior Lecture, and in 1958 he was appointed to a Randerthru In Zooleay in recognition of his research archiverenests. On the establishment of a new Department of Entomotogy in early 1970, he became its first Professor of Entomotogy and Head of Department. In April 1970, he sket became the first Def the newly assistables Peculty of Agranders.

Professor Odhaimbo has served in many capacities in Kenya, as a Board member in many institutions, and has participated in many international forums discussing technical advances in accence as well as accence, policy.

Professor Odhambo is the Director of the International Centre of Insect Physiology and Ecology, which, though an independent institution, is closely aspociated with the University and is located on its Chiromo Campus.

THIS IS A DUDU WORLD

A PASSAGE in ancient Arabic literature by Al-Qualquashandi about the kings of the Mell Kingdom referred to Meri Diata II, who ruled this great West Africa kingdom in the fourcenth century. The nassage, when translated, states as follows:

"His end was to be overtaken by the sleeping sickeness which is a disease that frequently beights the inhabitants of three countries, and especially their chiefaints Sheep avertakes one of them in such manner that it is hardly possible to avake thim He (the Kiva) remained in this condition during two

years until he died in the year 775 A.H. (A.D. 1373-4)."
Mart Diata II died of eleeping elckness, probably caused by the protozoal parasits, Trypanosoma gambiense, and transmitted by teese files, biting files of the genus Giossians.

At this time, elegoing suckness was well known and prevalent in Mall and other areas of tropical Africa. The disease is scute and affacts both man and his Duestook N is thought that the earthcolonizers of Africa, the Arabs, found it difficult to extend their sobere of influence permanently into the interior of the continent because of the difficulty of traversing the testes fluid fested areas. The Portuguese, who mounted large exceditions into the interior of Fast Africa during the eixteenth century, found their efforts repeatedly floundering when targe numbers of their camels and horses were hitten by teetra files and fell victim to alsenurg sickness. Ibadan may have in part, acquired its pre-aminance as one of the largest cities of Black Africa by the rayages the lastse flies wrought upon the Futani cavalry in the mid-1800's. No horses could be kent in Ibadan and Yoruba-land because of trypanosomizals. The Futani cavalry swent south trying to centure Yoruba-land, but their horses execumbed to the fly disease, and their drive was halted. However, the dwelfert of the rayaged villages moved to thadan and swelled its nonulation

The history of alexping sickness in Africa, and its vacior, the issue by, is not only of recent predominence. It goes bett, with reasonable certainty, as far as our archaeological looks can take us. Files of the genus officashes are premently confided to the countries of Africa fossis records of them have been found in the Miceans bees of North America. Protocol Bascallass of the family Transnoomatides are

also known to be of considerable geological age, and it has been speculated that they first invaded invertebrate books (such as tooling flux) in which they cause no annurent disease, before they came into contact with man and Isvestock. Consequently, both sleeping sickness's tected flies are of great antiquity, and must have been prevalent in the very areas where early hominids made their first man-lake evolutionary experiments Frank L. Lambracht! has speculated that man may have arose first in African when, during the late Museum or the Plinouse certain branches of the primate coder in A from left the forest environment and took to the savanah. He forether speculated that these early ground-dwellers found 'empty' acological righest unoccurred by the elimination of large groups of animals which succumbed to the acute form of steening success usually found in the savannah environment. Whatever substance these speculations contain, it is nonetheless clear from oral tradition and written records that teetse-horne trynanosomiasis has long been a notent factor in the history of Africa?

But so has makers, a man kaller of mayor procordions. Makes have have have held possible to have first if not suppress that many Affran peoples believed that the densate was counted by the many Affran peoples believed that the densate was counted by the many have been been suppressed to the counter of the many have been permitted and work on a reliquid possibilitation summoring his discovery Tropical Affra is distinguished by other maper insect produces—the Desert Locust, the Margardy Lecust, the Red Locust, and the counter of the summoring t

"Some men see things as they are and say, why."

I have tried to do this already; but it is rather unsatisfying and I would rather push for what Robert Kennedy had to say later.

"I dream things that were never and say, why not."

INSECTS AS A NATURAL RESOURCE

INSECTS are one of the most important elements of our troposal natural restource. The forests of our involvable humid responsal areas have beauthed to use a rail intent funes a shoot authrible to synthesis and the second of the second second to the secon

"The obiya grasses are flowering And the policik obissions And the wild white littles Are shouting silently To the bees and buserfies! And as the fragrance Of the ripe wild berries Hooks the insects and title birds. As the fishermen hook the fish and out them so merclessis.

The young men From the surrounding villages And from across many streams They come from beyond the tills And the wide plotns They surround you And bite off their ears Like lackals

These touching words are a mere indication of the deep identification of insects with Nature, of the agnificant place that they occupied in the houghts and sendments of African peoples.

Buil, Ihan, its sects have always played a central role in the Ihoughts and pursuits of thoughtful men Ihroughoul the agos. We have, for leatures, that intropid Franch saturalist of lihe nineteenth century, Henrif Fabre, itsending thore than 40 years studying dune beeles.

sione, besides more years spent on the study of waspe, bees, butterflies, and other insects. His study of the dung beetles shows both his empathy with insects as well as his understanding of their role in the environment 4.

"There is, to my knowledge, only one other example of times preparing board and lodging for their firmily, as of the gatherer of honey and the burier of weil-flated game-bags solution of the state of honey and the burier of weil-flated game-bags solution with the flavor-describing time of the consideration of the shower describing time of their or the solution of the state of the

Novenhanasting their sitepasting occupation, the Dangbustins are of a very respectable standing. Their star — which is generally imposing — their severe and immuculately gaugest arter, their portly bodies, inchess and compact, the gaugest ornamentation of horse or thorus all combined make them can be extended as the start of the start of the concine accession figure in the collector's bavore, especially on the compact of the control of the contr

Such as idealizate view of Nazare was carred very far to the inchresenth and early part of the present century, elimost verging on a new trend in philosophical thought. A prime reponent of this trend was Maurice Marteninek, who occupied hizmed with the study of social insects, especially the bees and termiles, and derived from it models of found exponsiation that because the energies of social and scientific controvery in the deside before the first World Wat-!. Materianck was impressed with the very complete belong of the Materianck was impressed with the very complete belong of the

Materinck was impressed with the very complex biology of terminet (the to-called while and so and their mount artisticeture. His research experience made him talk of the "political, economic and social organization" of termines; he considered which the termed the "destign" of termines as presenting the destroy of manking, unless we cost stock of the situation and changed our very tellore. It was too late, he severed that termines had overcome the many rigours of life and existence in this world beauses they possissed which is booking and existence in this world beauses they possissed what is booking faculty, ulthough we prifer per of to call it initiates, for no special reason — to he and, by believed that territies are all one to reasons from the angle of the period of territies are all one to reasons from the angle of the period of the period in t

"Their civilization, which is the earliest of croy, is the most curious, the most complex, the most inselligent, and, no sense, the most logical and best flived to the difficulties of existence, which has ever appeared before our own on this gibbe From served points of two this civilization, thinough force, sindster and often reputitive, is superior to that of the bee, of the not, and even of max himself".

From African ballads on Nature to the European poetic renderings of the doines of Nature: from philosophical mutterings on insect civilization to the dainty expressions on insect aesthetics; and so we come to the age-old hankerings after beautiful things. And what else are butterflies if they are not beautiful things, possessing a dainty strong care in the inventory of living premiums. Because of their innocuousness and breathtaking beauty, many people, including the areat Englishman, Winston Churchill, have actually gone out of their way to create a butterfly garden - to watch butterflies as they flit from one suppy flower to another sweet pactary, to observe their silent but swift courtship displays, to wonder at their sense of time and season* They talk of a butterfly garden, a butterfly nursery, a butterfly sanctuary; they argue over the exchange of butterfly livestock with like husbandrymen in other countries. They tell you that if you keep one or more generations of breeding butterflies in controlly under a polythene-covered greenhouse, and tend them well providing them with drinking water and honey water, the butterflies become so teme and domesticated that they could feed from a hand holding a not of honey water, and, if let loose to wander in the surdens during the day, they returned to the greenhouss to roost at a.abs

No wooder the study of butterfise had drawn the attendon of many overtanding naturalists in tropical Africa. Juckson, Van Someran, Stoncham, and many others are little causes as experted of East, African Imployment on the control of the Company o

African countries to conserve our national heritage of animal and pate life. The more invastanced effort in this direction has been to establish analosal paris, which are usually located on marginal leads, on our parameters, and when smight feature in the tag arms. But the same configuration of the parameters are supported to the parameter of the parameters and the parameters of the direction of the parameters of the param

This is not to say that our sevannsh areas are devoid of captivities to betterfiles and other function. On the contrary, many species haunt the flowers and nectaries of the strints and weeds, and there is no sight on engrossing as a bank of weeds by the stream on a many day powdered by the myrisks of multi-colouried butterfiles, been, files and age that a contract of the stream of a many day powdered by the myrisks of multi-colouried butterfiles, been, files and general stream of the str

INSECTS AS A COMPETITOR

BUT insect life is not all sweet life We do not even like some of the things they do, sithough we may understand it. So like Oost, hurling verbal accusetions on the village Padre, we might sey with here.

"And when he shouted The word 'gractya' (Whatever the word meant) Salve squirted from his mouth and froth flew

Like white ants from his mouth The smelly drops Landed on our faces Like heavily loaded houseflies Fresh from a fresh excreta heap."

Afriza possesses something like 300,000 known species of insects and their close sethropoof relatives, such as sicks and miles. Many more are raid to be discovered, described, and designated — purticularly the smaller bestlee, fine, waspe, mothe, plant blag, spring talls, and miles From this rick lessed fature, only something like AQO species — on this more than 1% — are penticlevous to man and the agranitural produce. Even so, this small fraction forms large in the economy and public beath of man, and to this state therefore

Man in Africa has always been interested in insects, including the pentiferous ones. And although they have worked out reasonable avoiding action for some of these petat For instance, some of our pets to agricultural stored products, by storing them in ask and traditional granies incorporating sophisticated manoclinates deserve can safely say that in long-standing traditional methods exist for the extermination or control of any of our next.

Ower the last 90 years or so trooped Africa has seen the dawn of modern insect science and technology. Many of its vectors of human and animal discusses - trypanosomiasis malaria. East Coast Fewer relavaing fever, yellow fever, filariasis, and many other horsestons tropical diseases - have been subjected to modern scientific study. But one must admit that successes have been limited. We have succeeded in setting relief from these diseases, by discovering parative methods for dealing with the disease in its evert state, we have also evereded In destroying the insert perty prepared for a limited period of time using firebrigade methods, such as pesticides; but what we have not supposeded in doing is to control any specific insect nests often a force period and over a whole reason. An overview of the pest situation seems to indicate that we have succeeded in controlling that not in eliminatine) only three pestiferous insects on a lone term basis. The first is the ispeer, which was accidentally introduced from South America in the seventeenth century presumably by the returning slave traffic. It spread like wildfire in a population unfamiliar with this new pest, and decimated the indigenous population of West and Central Africa until, more than a century later, they came to learn how to control it - by the simple expedient of removing the larval open as soon as its stebung presence became apparent

The second pest in tropical Africa to have had devised air excellent long-leaning control programma is the coffee mealybug, Planococcus Kenyae, which, in the early history of the Kenya coffee industry East of the Rift, was a devastating pest of this important aericultural crop. The mealybug forms thick clusters near the tips of growing points and among the grean berries or flower buds, joopardising the full development and fruiting of the plant. Chemical control can give some retief; but very good control of the pest has been achieved by the introduction of its insect parables from Usanda is 1930.

The third pest, whose long-term control has been schieved in tropical Africa, is the cotton leafhonner, Emposson facialts, which wer a serious past of cotton wherever it was grown in tropical Africa especially under irrigation conditions, until the early 1940's. It is a now insert able to insignate itself between the bairs on the young leaves of the cotton plant, from which it then proceeds to make plant luices. The result of infectation is "hopper-burn", characterized in the early stages by the edges of the affected leaves changing colour to yellow or red in successive zones, which seems to be the result of the interruption of translocation of plant sap through the plant vehicular vessels, the phloera These initial symptoms are succeeded by a curling of the leaves, which may eventually dry un or he shad If the infestution occurs on young plants they growth may be entirely arrested; if it occurs on older plants, their crop will be shed or they may be capable of producing only immature lint: in any case. lowest due to leaftionner attack are usually serious in the cotton growing areas of the dry savannuk. The early discovery that bairy cotton plants seem to be resistant to leaf-hopper attack was intensely exploited in breeding programmes utilizing a diverse genetic source of the cotton plant, and so the 1940's it became apparent that long have on the leaves were directly responsible for conferring on cotton niants resistance towards leaf-hooser attack. It turned out that the resistance was due to the hairs preventing females from laving eggs on the leaf surface: the hairs did not pacemently prevent them from feeding. Breeding for this rather simple resistance factor has made an outstanding contribution in the control of the cotton leaf-hopper to the level when it can only be regarded as a very minor pest.

The control of the three peets already mentioned, over a period of approximetry 150 years of pest management is a miliarable returns whichever way we consider the matter. At the present raise of the solution of pest problems in tropical Africa, it will take us another 200 consults to solve the remaining major pests. Drivinsally, we must adopt other strategies to quicken the pace of advance to pest management personnel.

And, on, to Generis.

"And God said, Let the earth bring forth the living creature after his kind, cattle, and creeping thing, and beast of the earth, after his kind: and it was so. And God made the beast of the earth after his kind, and cettle after their kind, and everything that creepeth upon the earth after his kind; and God saw that it was good

And Grid said, Let us make man in our image, after our likeness; and let them have dominion over the fish of the sea, and over the foul of the drt, and over the castle, and over all the earth, and over creeping thing that creepeith upon the earth.

And God blessed them, and God said unto them, Be fruitful, and multiply, and replexish the earth, and subdue it and have dominton over the fish of the sea, and over the fowl of the sir, and over every living thing that moveth upon the worth."

earth.

How best can man have dominion over pestiferous insects without at the same time spouling his dominion by avoiding practices that will ha deleterious to its long-term ecology? This is the crux of the matter in entityletion doest management.

PESTICIDE FAMINE

IT IS canalisated that 14% of the landersess of the continues of Africa s deficience in manifest souther 75 is innocessations, and so not much use for agraculture. Even so, Africa contains more lend of high contractions of the contraction of

It is recognized that agricultural practices in this continent must change — better husbandry methods, better marketing and distribution, better incentives to the farmer, better integration of modern science and technology into agronomic techniques, and better agricultural inputs.

Parallel to the recent acuta oil crisis, there is also looming a fer-

tiller finnse and a pesitide finnse to 1960's the annual world tools for firetitize consumption was about 3-40 midten marter, som 50 ft. Int. total. It is a great that for the foresemble flature one will be to contree to use periods, but it is recombed to suggest that the use should be assectioned only under specified conditions. Firstly, that the succession of the control of the succession of the careful study of the peer involved, no that there use a specific to the relevant study of the peer involved, no that there use a specific to the relevant study of the peer involved, not that there use a specific to the relevant study of the peer involved and the control of the careful study of the peer involved to the control of the peer in the study of the control of the control of the control of the components, or new alternative periodical compounds, or emiss to be components, or new alternative periodical compounds, or emiss to be components, or new alternative periodical compounds, or emiss to be

These proposals, especially the last two, may seen stary-eyes, it that a shout 10 years for the discovery of a new pharmacological agent to be developed into a commercial product, such as a drug or a particled. The interaction in these 10 years of remeasts and development is also encorroous. It does imply that the development is also encorroous it does imply that the development is also encorroous it does imply that the development is manufacturer to end yearing to invest each large amounted of time and moment if the is certain to the substantially rewarded at the end of the carection.

TOWARDS A NEW ORDER

BEFORE the discovery of DDT and the subsequent avalanche of advances in the characterisation of other new pesticides since the 1940's, pest control was largely a matter of using the hammer-and-sone sectorious. You sate the next (occusts and termiles are dramatic

examples), you shot the suspected summal generois of the disease from where suscess destribeded of its to like use of the azimilar house of teste flux), or you pecked and killed the offending innect (as a the case of low and holding.) These techniques by and large fielded to idealer mixed in the case of low and holding. The sever toll of positionists whereast in an era of the fiber-largued approach. This places has been expected, and the consequence spectically archives the substitution of the short large. But the substitution is not not seen to find a fiber-largued supposed. This places has been supposed to not seen to offer a long-largue, renveronmentally acceptable on the substitution of the su

It looks as if we should east our minds for a more scentific method, which recognizes that muests are not simply targets, but as biological entities with a complex ecology, behaviour, and physiology, entities that have a complex genetic potential the enable them to evolve beyond a particular situation, and entities which occupy an important place in the natural order of things

Such an approach, a pest management approach, now seems to be such an approach, a pest management approach, now seems to be ameraing from the obscure horizons. It presupposes a great deal of fundamental information on the individual insect species - in as great s depth as required for any one of our domesticated animal species if we are to suggest new evenues for controlling insect past species authin acceptable population limits. We also need to know a great deal about the underbone principles of the neculiarities of insect life for the same reasons. This is the type of strategy and perspective that the ICIPE is striving to achieve. We are gradually coming to realize that insect communication is performed overwhelmingly by means of chemical messages rather than by the use of other means of communication familiar to man - visual and auditory. These messenger chemicals, or pheromones are employed in such a precise manner that in the termites and other social insects one can begin to believe that insects do indeed have a kind of chemical stokabet and phraseniony for effective communication for food, courtship defence and other necessities of life. This is one example to demon. strate the promuse that such a strategy portants. Other leasest neculiarities are first as fascinating

It is my firm belief that respond Arica, with its rish and diversified senset fause, has common potential for making a might would contribution in this area of human endeavour. Insect science, the study of insects in all less relations with the sentral world, it still very much a point science. One case over any that the older activations are part of the milightened public that has witnessed the very belief. If we decide to put our mucks to the less of angloring the many discoveries that such us with a world witnessed to the settle and the still early that the will early the sentilization in a future still early the sentilization in a future stress that most only be excitigation in a future stress.

science but in solving one of the most crucial problems in the tropical

I dream that I dream the dreams of dreamers; That dreams are not just dreams. But are the undreams of dreams of unlimited horizons.
